It may be noted that the width of the image included was specified relative to width of the text (). It is a good idea to use relative sizes to define lengths (height, width, etc), particularly when using wrapfigure.

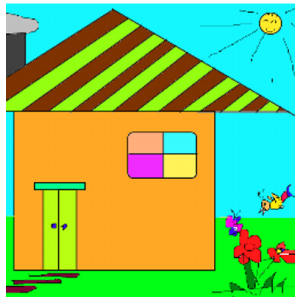

Figure 1: HOUSE

In the example above, the figure covers exactly half of the the textwidth, and the actual image uses a slightly smaller width, so that there is a pleasing small white frame between the image and the text. The image should always be smaller (less wide) than the wrap, or it will overrun the text.
